## 5.2 Improving the lamp panel

The LEDs on the lamp panel are rather small and it may be difficult to read the letters printed on the PCB next to the LEDs. You may improve the readability by fitting a film, containg the 26 letter of the alphabet, over the LEDs. A suitable film is supplied with your kit (inside the back cover of the manual), but you may want to experiment with alternative designs. The support page on our website contains some letter designs for download, allowing you to print your own film.

The film can be held in place, by creating a sandwich construction. Find two pieces of transparent plastic or plexiglass, and cut them to the same size as the lamp panel film. Fit the film in between the two pices of plastic and use spacers to fit the lot to the mounting holes in the PCB.

More examples are available on the **Enigma-E** website.
